Title: Dialing Method of Searching Telephone Number in Portable Telephone

Abstract

A dialing method in portable telephone comprises storing frequently used phone numbers in a first memory, storing less-frequently used phone numbers in a second memory, and searching for a stored phone number, in said first memory, which matches one or more digits received from keypad. If said matched phone number found, it would be shown in the display of said portable telephone. If no said matched phone number found, continuing said searching for said matched phone number in said second memory. No matter said matched phone number shown in the display is found in said first or second memory, dialing said matched phone number in response of received dial key from user.
